Professor Runciman's research interests are late-nineteenth and twentieth century political thought; theories of the state and of political representation; various aspects of contemporary political philosophy and contemporary politics. He is also joint-PI on two major research projects based in CRASSH: Conspiracy and Democracy and Technology and Democracy, one of which looks at the possible implications of machine learning and artificial intelligence for democratic politics. What will these changes mean for accountability, representation and collective identity? Who will be responsible for what in a world where many decisions are franchised out to machines? What role will be left for public opinion and electoral politics? This research will also explore some of the historical parallels and in particular the comparison between AI and other forms of artificial decision-making. Are robots so different from corporations, and if so, how?
